## **(Subject Code-PCI7J002)**

### **MODULE-I**

**Dr. P.K. Muduli**

Associate Professor(Civil Engg.)

Govt. College of Engineering, Kalahandi,  
Bhawanipatna, Odisha, India

# Introduction: Ground Improvement Methods and its selection

**Civil Engineering Materials:** Steel, concrete, brick stone, timber, glass etc. Many a times we miss one most important material. i., e., soil.

**Soil versus other civil engineering materials:**

**Steel and concrete:** Manufactured, can be produced with desired strength and stiffness, quality can be monitored

# Introduction: Ground Improvement Methods and its selection

- **Soil: Formed Naturally, properties mostly not known or depends on many factors, no control over its quality**

## **Introduction: G I Methods and its selection**

- **With the increasing demand on urbanization we need to venture to more challenging sites to built more houses, commercial buildings, high-rise office buildings, highways, railways, tunnels, earth dams etc as suitable site with favorable geotechnical conditions is not abundantly available**

## Introduction: G I Methods and its selection

Type of Geo-material	Name	Potential Problems
<b>Natural</b>	<b>Soft Clay</b>	<b>Low strength, high compressibility, large creep deformation, low permeability</b>
	<b>Silt</b>	<b>Low strength, high compressibility, high liquefaction potential, low permeability, high erodibility</b>
	<b>Organic Soil</b>	<b>High Compressibility, Large creep deformation</b>
	<b>Loose sand</b>	<b>Low strength, high compressibility, high liquefaction potential, high permeability, high erodibility</b>
	<b>Expansive soil</b>	<b>Large volume Change</b>
	<b>Loess</b>	<b>Large volume change, high collapsible potential</b>

# Introduction: G I Methods and its selection

## Problematic Geo-material and potential Problems

Type of Geo-material	Name	Potential Problems
<b>Fill</b>	<b>Uncontrolled fill</b>	<b>Low strength, high compressibility, nonuniformity, high collapsible potential</b>
	<b>Dredged material</b>	<b>High water content, low strength, high compressibility</b>
	<b>Reclaimed fill</b>	<b>High water content, low strength, high compressibility</b>
	<b>Recycled material</b>	<b>Non-uniformity, high variability of properties</b>
	<b>Solid waste</b>	<b>Low strength, high compressibility, nonuniformity and high degradation potential</b>
	<b>Bio-based by-product</b>	<b>Low strength, high compressibility and high degradation potential</b>

# Introduction: G I Methods and its selection

## Geotechnical problems and possible causes

Problem	Theoretical Basis	Possible Causes
<b>Bearing Failure</b>	<b>Applied pressure is higher than ultimate bearing capacity of soil</b>	<b>High applied pressure, inclined load, small loading area, low strength soil</b>
<b>Large total and differential settlement</b>	<b>Hooke,s law particle re-arrangement</b>	<b>High applied pressure, large loading area, highly compressible soil, non-uniform soil, large creep deformation</b>
<b>Ground heave</b>	<b>Swelling pressure is higher than applied pressure</b>	<b>Water, expansive soil, Frozen soil</b>
<b>Instability</b>	<b>Shear stress is higher than shear strength, driving force is higher than resisting force, driving moment is higher than the resisting moment</b>	<b>High earth structure, steep slope, high water pressure, soft foundation soil, high surcharge, high loading rate</b>

## Introduction: G I Methods and its selection

### Geotechnical problems and possible causes

Problem	Theoretical Basis	Possible causes
<b>Liquefaction</b>	<b>Effective stress become zero due to increase in excess pore water pressure</b>	<b>Earthquake, loose silt and sand, high ground water table</b>
<b>Erosion</b>	<b>Shear stress induced by water is higher than maximum allowable shear</b>	<b>Running water, high speed of water flow, highly erodible soil (silt and sand)</b>
<b>Seepage</b>	<b>Darcy's law</b>	<b>High water head, permeable soil</b>

## Introduction: G I Methods and its selection

### Ground Improvement Methods for Transportation Infrastructure

<b>Aggregate Columns</b>	<b>Electro osmosis</b>	<b>Micro-piles</b>
<b>Reuse of waste material</b>	<b>Excavation and replacement</b>	<b>Deep mixing</b>
<b>Bio-treatment for sub-grade</b>	<b>Geo-cell confined in pavement system</b>	<b>PVD</b>
<b>Blasting densification</b>	<b>Geo-synthetic reinforced in pavement</b>	<b>Rapid impact compaction</b>
<b>Chemical grouting/injection</b>	<b>Geo-textile encased column</b>	<b>Reinforced soil slope</b>
<b>Chemical stabilisation of sub-grades and bases</b>	<b>Injected light weight foam fill,</b>	<b>Sand compaction pile</b>
<b>Compaction grouting</b>	<b>Intelligent compaction</b>	<b>Traditional compaction</b>
<b>Deep dynamic compaction</b>	<b>Mechanical stabilisation of subgrades and bases</b>	<b>Vacuum preloading with and without PVD</b>
<b>Drilled/grouted soil nailing</b>	<b>Mechanically stabilised earth wall system</b>	<b>Vibro-compaction</b>

# Ground Improvement Methods

## Shallow Replacement

<b>Method and availability</b>	<b>General description</b>	<b>Benefits</b>	<b>Applications</b>
<b>Over excavation and replacement, widely used</b>	<b>Remove problematic geo-material and replace with good quality geo-material</b>	<b>Increase strength, stiffness and reduce deformation, liquefaction, collapsible and ground heave potential</b>	<b>Suitable economic for wide range of geo-materials with limited area and limited depth (typically to 3 m deep and above ground water table)</b>

# Ground Improvement Methods

## Shallow Densification

Method and availability	General Description	Benefits	Applications
Traditional compaction, widely used	Apply static or vibratory load on ground surface in a certain number of passes	Increase density, strength, stiffness and reduce permeability, collapsible potential	Suitable for wide range of fills to a lift thickness of 0.3 m, used to compact fill
High energy impact roller, Occasional use	Apply a lifting and falling motion by a roller with high energy impact on ground surface to densify or crush problematic geo-material	Increase density, strength, stiffness and reduce deformation, permeability, collapsible potential	Suitable for granular geo-materials up 6.0 m deep, used to improve subgrade and foundation soil and compact fill
Intelligent compaction, new and not readily available	Apply and adjust compaction energy based on on-board display from measurements in real time	Increase density, strength, stiffness and reduce deformation, permeability, collapsible potential, maximise productivity	Suitable for granular material, used to improve subgrade and foundation soil and compact fill

# Ground Improvement Methods

## Deep Compaction

Method and availability	General description	Benefits	Applications
<b>Dynamic Compaction, widely used</b>	<b>Drop a heavy weight from a high distance to apply high energy on ground surface, causing liquefaction of saturated problematic geo-material and densification of unsaturated problematic geo-material</b>	<b>Increase density, strength, stiffness and reduce deformation, liquefaction, collapsible potential to a greater depth</b>	<b>Suitable for granular geo-materials, collapsible soils and waste material with less than 15% fine to a depth of 10 m, used to improve foundations</b>
<b>Vibro-compaction Widely used</b>	<b>Apply a vibratory force and/or water by a probe on surrounding problematic geo-materials , causing liquefaction and densification</b>	<b>Increase density, strength, stiffness and reduce deformation, liquefaction, collapsible potential to a greater depth</b>	<b>Suitable for clean sands with less than 15% silt or less than 2% clay to a typical depth of 5-15 m, used to improve foundations</b>

# Ground Improvements methods and classification

## Deep Densification

Method and availability	General description	Benefits	Applications
<b>Sand compaction columns, widely used</b>	<b>Displace problematic geo-material by driving a casing into the ground backfill the hole with sand</b>	<b>Increase bearing capacity and stability, reduce settlement and liquefaction potential, accelerate consolidation</b>	<b>Suitable for a wide range of geo-materials to a typical depth of 5-15m, used to improve foundations</b>
<b>Stone columns, widely used</b>	<b>Jet water or air to remove or displace problematic geo-material by a probe and backfill the hole with stone to form a densified columns by vibration</b>	<b>Increase bearing capacity and stability, reduce settlement and liquefaction potential, accelerate consolidation</b>	<b>Suitable for a wide range of geo-materials to a typical depth of 5-10m (u to 30 m), used to improve foundations</b>

# Ground Improvements methods and classification

## STONE COLUMN : DRY / BOTTOM FEED METHOD

- Step 1 : Penetration of probe
- Step 2 : Installation of aggregate through separate duct along the vibro probe
- Step 3 : Consolidation of granular fill and finishing the column

# Ground Improvements methods and classification

## Deep Replacement

Method and availability	General description	Benefits	Applications
<b>Rammed aggregate column, quite popular</b>	<b>Pre-drill a backfilled with aggregate, densified by ramming</b>	<b>Increase bearing capacity and stability, reduce settlement and liquefaction potential, accelerate consolidation</b>	<b>Suitable for a wide range of geo-materials to a typical depth of 5-10m with a deep ground water table, used to improve foundations</b>
<b>Geo-synthetic encased columns, occasional use</b>	<b>Drive a steel casing to the ground to displace problematic geo-material replace with a geo-synthetic casing and fill</b>	<b>Increase bearing capacity and stability, reduce settlement, accelerate consolidation</b>	<b>Suitable and economic for very soft soil to typical depth of 5-10 m, used to improve foundations</b>

# Ground Improvements methods and classification

## Drainage

Method and availability	General description	Benefits	Applications
<b>Fill drains, widely used</b>	<b>Place a layer of permeable fill inside a roadway or earth structure</b>	<b>Reduce water pressure and collapsible and ground heave potential, accelerate consolidation, increase strength, stiffness and stability</b>	<b>Suitable for low permeability geo-material, used for roads, retaining walls, slopes and landfills</b>
<b>Drainage geosynthetics, quite popular</b>	<b>Place a layer of nonwoven geotextile or geocomposite in ground or inside a roadway or earth structure</b>	<b>Reduce water pressure and collapsible and ground heave potential, accelerate consolidation, increase strength, stiffness and stability</b>	<b>Suitable for low permeability geo-material, used for roads, retaining walls, slopes and landfill</b>

# Ground Improvements methods and classification

## Dewatering

Method and availability	General description	Benefits	Applications
<b>Open pumping, widely used</b>	<b>Use sumps, trenches, and pumps to remove a small amount of water inflow in open excavation</b>	<b>Remove water to ease construction</b>	<b>Suitable for a small area, relatively impermeable soil, and lowering of the ground water table by a limited depth in open excavation</b>
<b>Well system, quite popular</b>	<b>Use well point and/or deep wells to remove a large amount of water inflow in open excavation</b>	<b>Remove water to ease construction increase stability of excavation</b>	<b>Suitable for large area, relatively permeable soil, and lowering of the ground water table by a large depth for excavation</b>

# Ground Improvements methods and classification

## Consolidation

Method and availability	General description	Benefits	Applications
<b>Fill Preloading, widely used</b>	<b>Apply temporary surcharge on ground surface for a duration and then remove the surcharge for construction</b>	<b>Increase soil strength, reduce settlement</b>	<b>Suitable for saturated inorganic clay and silt, used to reduce settlement for foundation soil</b>
<b>Vacuum preloading, moderately available</b>	<b>Apply vacuum pressure on ground surface and/or through drains into the ground for a desired duration and then remove the pressure for construction</b>	<b>Increase soil strength, reduce settlement</b>	<b>Suitable for saturated inorganic clay and silt, used to reduce settlement for foundation soil</b>

# Ground Improvements methods and classification

## Ground Improvements methods and classification

### Shallow Chemical Stabilization

Method and availability	General description	Benefits	Applications
<b>Chemical stabilisation of sub-grade and base, widely used</b>	<b>Mix lime, cement and/or fly ash with sub-grade and base course in field and then compact the mixture, have chemical reaction with soil particles to form a cementitious matrix</b>	<b>Increase strength and stiffness, reduce ground heave potential</b>	<b>Suitable for unsaturated clay and silt, mainly used for roadway construction with a typical lift thickness of 0.3 m.</b>

## Ground Improvements methods and classification

### Deep Chemical stabilization

Method and availability	General description	Benefits	Applications
Grouting, quite popular	Inject grout into ground to fill voids, densify soil and have chemical reaction with soil particles to form a hardened mass	Increase strength, reduce permeability, liquefaction, and ground heave potential	Different grout suitable for different geo-material, mainly used for remedying measures or protective projects
Deep mixing, quite popular	Mix cement or lime from surface to depth with geo-material by mechanical blade to have chemical reaction with soil particles after mixed to form a cementitious matrix	Increase strength, stiffness and stability, reduce permeability, liquefaction and ground heave potential	Suitable for wide range of geo-materials, mainly used for foundation support, earth retaining during excavation and liquefaction mitigation

# Ground Improvement Classification

## Fill Reinforcement

Method and availability	General description	Benefits	Applications
<b>Geo-synthetic reinforced slopes, widely used</b>	<b>Place geo-synthetic in slope at different elevation during fill placement to provide tensile resistance</b>	<b>Increase stability</b>	<b>Suitable for low plasticity fill, mainly used for slope stability</b>
<b>Geo-synthetic reinforced embankments, widely used</b>	<b>Place high strength geo-synthetics at base of embankments to provide tensile resistance</b>	<b>Increase bearing capacity and stability</b>	<b>Suitable for embankments over soft soil, mainly used for enhancing embankment stability</b>

# Ground Improvement Classification

# Ground Improvement Classification

## Fill Reinforcement....contd

<b>Method and availability</b>	<b>General description</b>	<b>Benefits</b>	<b>Applications</b>
<b>Mechanically stabilised earth wall, widely used</b>	<b>Place geo-synthetic or metallic reinforcement in wall at different elevations during fill placement to provide tensile resistance</b>	<b>Increase stability</b>	<b>Suitable for low plasticity free draining fill</b>
<b>Geo-synthetic reinforced roads, quite popular</b>	<b>Place geo-synthetic reinforcement on to of sub-grade or within base course to provide lateral constraint</b>	<b>Increase bearing capacity &amp; roadway life, reduce deformation &amp; base thickness requirement</b>	<b>Suitable for granular bases over soft sub-grade</b>

# Ground Improvement Classification

# Ground Improvement Classification

## In-situ Reinforcement

Method and availability	General description	Benefits	Applications
Soil nails, quite popular	Insert a steel bar with grout throughout the whole nail in existing ground to provide tensile resistance and prevent ground movement	Increase stability	Suitable for low plasticity stiff to hard clay, dense granular soil and rock, mainly used for temporary and permanent slopes and walls during excavation
Micro-piles, quite popular	Insert a steel reinforcing bar in a bored hole, grout in place to form a small diameter pile(<0.3m) and provide vertical and lateral load capacities	Increase stability, protect existing structures during ground movement	Suitable for variety of geo-materials, used for slopes, walls and underpinning of existing foundations

# Ground Improvement Classification

# Ground Improvement Classification

## Thermal and biological treatment

<b>Method and availability</b>	<b>General description</b>	<b>Benefits</b>	<b>Applications</b>
<b>Ground Freezing, occasional use</b>	<b>Remove heat from ground to reduce soil temperature below freezing point and turn geo-material into solid</b>	<b>Increase strength, reduce water flow and ground movement</b>	<b>Suitable for saturated clay and sand, used for temporary protection during excavation</b>
<b>Biological treatment, rare use</b>	<b>Utilise vegetation and roots to increase shear strength of soil or change soil properties by bio-mediated geochemical process</b>	<b>Increase strength and stiffness , reduce erodibility and liquefaction potential</b>	<b>Suitable for cohesive and cohesionless geo-materials, requires more research and field trial before it is adopted in practice</b>

# Ground Improvement: Selection of Method

# Ground Improvement: Selection of Method

(a) Unreinforced cut and fill slopes

(b) Unreinforced cut and fill earth walls

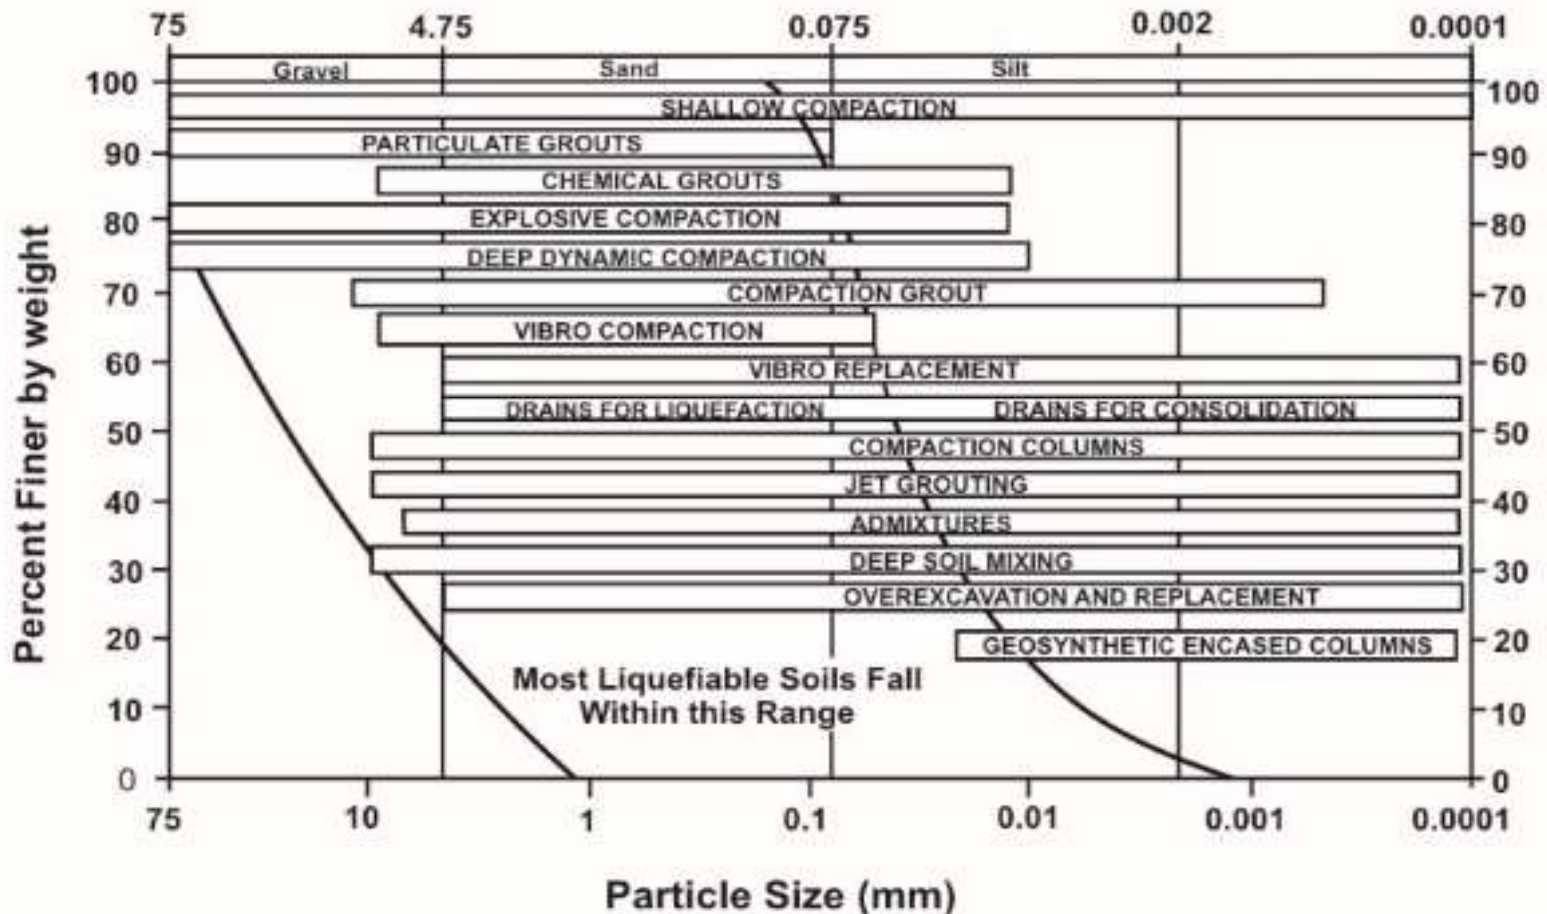

(c) Reinforced cut and fill slopes

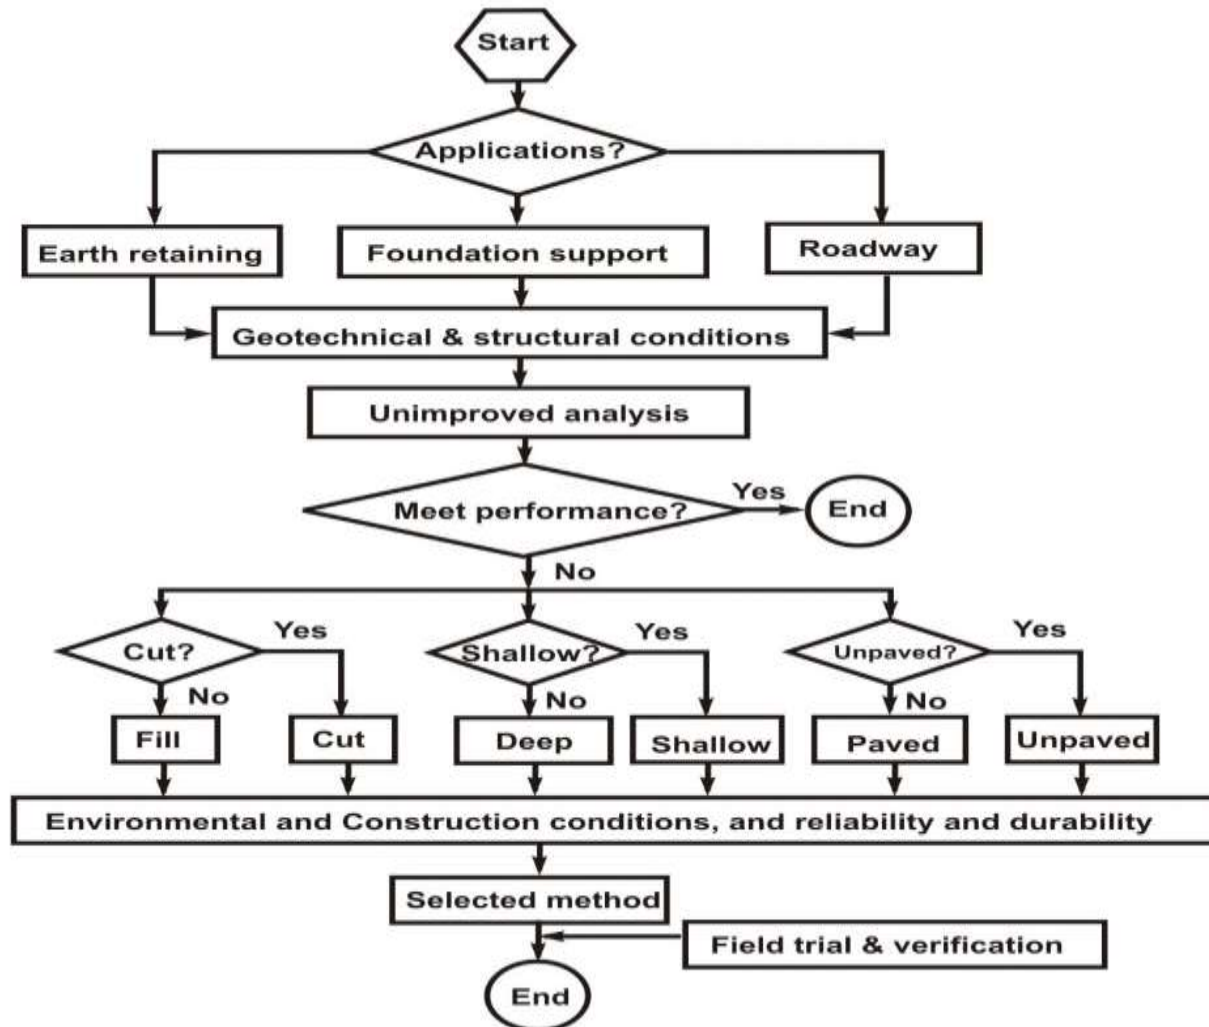

(d) Reinforced cut and fill earth walls

# Ground Improvement: Selection of Method

**Factors for Selection of Ground Improvement Methods:** Structural, Geotechnical, Environmental, construction constraints and reliability and durability

# Ground Improvement: Selection of Method

# Excavation and Replacement

# **Excavation and replacement**

## **Application**

**Improving shallow problematic geo-materials. It includes uncontrolled fill, loose sand and silt, soft soil, expansive soil liquefiable soil and frozen soil. Excessive deformation and/or potential bearing failure occurs due to low strength during service. In the following event it is frequently used:**

- The area of over excavation is limited**
- The depth of excavation is less than 3m**
- No or limited temporary shoring and dewatering are required**
- No existing structure is close to the over excavation area**
- Removed soil can be easily disposed or reused**
- Fill material is readily available**

# Excavation and replacement

**The method can be used for:**

- **Increase bearing capacity**
- **Reduce settlement**
- **Eliminate expansion/shrinkage of expansive soil**
- **Eliminate the freeze-thaw of frozen soil**

**Commonly used to improve geo-materials under continuous and isolated footings. It is also used for highways and railways construction when problematic geo-materials are encountered within limited areas and depth**

## Excavation and replacement

### Advantages:

- Often cost effective when area and depth are limited
- Fill material is readily available
- Simple, reliable and well established
- Does not required specialty contractors and special equipment except excavators and rollers

# EXCAVATION AND REPLACEMENT

## Disadvantages

- Method is unsuitable when deep excavation is required
- Method is unsuitable when high ground water table
- Method is unsuitable in presence of onsite or nearby existing structures and utility lines
- Method is unsuitable when limited truck access to the site
- Method is unsuitable when the distance is long for hauling fill material and disposing of excavated soil
- Method is unsuitable when time is limited

# EXCAVATION AND REPLACEMENT

## Principle

- **Partly or fully replacing problematic soil by good soil**
- **Complete replacement is preferred**
- **Partial replacement is acceptable and more economical as long as performance of the structure satisfactory on partially replaced zone**
- **For expansive soil, and frozen soil depth of excavation should be greater than the active depth of problematic soil**
- **For uncontrolled fill, loose sand and silt, and soft soil, the depth of excavation should be greater than or equal to the width of the foundation on replaced ground to meet bearing capacity and settlement requirement**

# EXCAVATION AND REPLACEMENT

## Design Consideration

In addition to the bearing capacity and settlement other requirements namely, swelling, liquefaction etc should be considered while designing the replaced zone. The parameters to be designed:

- Depth of replaced zone
- Length and width of replaced zone
- Fill quality including strength and modulus of fill

Also in addition to the above one should examine the all possible modes of failure

# EXCAVATION AND REPLACEMENT

## Failure modes:

- General failure within the replaced zone

# EXCAVATION AND REPLACEMENT

- Punching failure within the replaced zone

# EXCAVATION AND REPLACEMENT

- The distributed failure through a replaced zone

# Excavation and replacement

- Punching failure of replaced zone into the underlying weak soil
